

Protecting your LED fixtures from COVID-19

With the ongoing pandemic, your safety and well-being are of utmost concern at Green Image Tech. In an effort to protect you from the COVID-19 virus, we are now offering BioGard Technology's protective coating for our products.

What is BioGard Technology?

BioGard Technology is a photocatalytic shield that continually protects surfaces against deadly microorganisms such as viruses, bacteria, and fungi; and has shown to be >99.99% effective by numerous certified tests.

How does it work?

The antimicrobial effects of BioGard are created by reacting with the sulfhydryl inside microbes that come in contact with the coating. BioGard effectively inhibits the microbe's growth and reproduction before breaking down its cell structure, effectively killing it. Due to the coating's photocatalytic properties, an extra boost of sterilization is added when exposed to visible light.

Is it safe?

Yes! BioGard Technology has obtained FDA registration and listing, as well as Swiss SGS & China Center for Disease Control skin and oral cytotoxicity reports showing no cytotoxic responses in cells. Alongside USA MicroBac antiviral and MedicalCentre antibacterial reports, BioGard Technology has done tests for various globally recognized standards and quality benchmarks.
